

Model 7810 Furnace Failure Detector

FEATURES

- No external power required.
- Simple, two wire connection.
- Automatically restores to normal when temperature problem corrected.

Model 7810

DESCRIPTION

The 7180 furnace failure detector is a small, inexpensive fixed temperature thermostat that provides contact closure at 40°F.

In reality, a homeowner can have more damage on their hands from a furnace going out than from a break-in. If a furnace fails unnoticed on a cold day or night, anything in the house that holds water—sinks, pipes, radiators, toilets, dishwashers—can freeze and burst, creating significant repair and replacement costs. In just a matter of hours, a house can have serious problems if its furnace shuts down during the winter. With a 7810 installed, a central station can be alerted to the problem in order to correct the situation and head off repair problems.
